## 1 Descriptives

Data was converted to z-score and collapsed in three sections within each album. After that, I computed the overall mean and the standard error across all album sections. Results are displayed below.

\*note: since means were calculated within each album, there was no imbalance on the number of tracks within each album section. Standard errors were calculated with a fixed amount of observations (number of albums in our dataset). Within each album, however, the last segment got 1 fewer track in case the album length was not divisible by 3.
